

ABB MEASUREMENT & ANALYTICS | OPERATING INSTRUCTION

# SensyMaster FMT230, FMT250

# Thermal mass flowmeter

Measurement made easy

# **Further information**

Additional documentation on SensyMaster FMT230, FMT250 is available for download free of charge at www.abb.com/flow.
Alternatively simply scan this code:

## **Short product description**

Thermal Mass Flowmeter on the mass flow measurement of gases and gas mixtures in closed pipelines.

## Device firmware version:

- 01.00.07 (Modbus)

## **Additional Information**

Additional documentation on SensyMaster FMT230, FMT250 is available free of charge for downloading at www.abb.com/flow. Alternatively simply scan this code:

# 1 Safety

## 1.1 General information and instructions

These instructions are an important part of the product and must be retained for future reference.

Installation, commissioning, and maintenance of the product may only be performed by trained specialist personnel who have been authorized by the plant operator accordingly. The specialist personnel must have read and understood the manual and must comply with its instructions.

For additional information or if specific problems occur that are not discussed in these instructions, contact the manufacturer. The content of these instructions is neither part of nor an amendment to any previous or existing agreement, promise or legal relationship.

Modifications and repairs to the product may only be performed if expressly permitted by these instructions. Information and symbols on the product must be observed. These may not be removed and must be fully legible at all times. The operating company must strictly observe the applicable national regulations relating to the installation, function testing, repair and maintenance of electrical products.

#### 1.2 Warnings

The warnings in these instructions are structured as follows:

## **⚠** DANGER

The signal word "DANGER" indicates an imminent danger. Failure to observe this information will result in death or severe injury.

## ♠ WARNING

The signal word "WARNING" indicates an imminent danger. Failure to observe this information may result in death or severe injury.

## **A** CAUTION

The signal word "CAUTION" indicates an imminent danger. Failure to observe this information may result in minor or moderate injury.

#### **1** NOTICE

The signal word "NOTICE" indicates useful or important information about the product.

The signal word "NOTICE" is not a signal word indicating a danger to personnel. The signal word "NOTICE" can also refer to material damage.

#### 1.3 Intended use

This device can be used in the following applications:

- As a plug-in sensor flanged into the pipe component in pipelines with nominal diameters DN 25 ... DN 200 (1 ... 8 in.).
- Through a welding adapter directly in pipelines of nominal diameter DN 100 (4 in.) and above, as well as for noncircular cross-sections.

This device is intended for the following uses:

- for direct mass flow measurement of gases and gas mixtures in closed pipelines.
- for indirect measurement of standard volume flows (through standard density and mass current).
- For measuring the temperature of the measuring medium.

The device has been designed for use exclusively within the technical limit values indicated on the identification plate and in the data sheets.

When using media for measurement the following points must be observed:

- Measuring media may only be used if, based on the state of the art or the operating experience of the user, it can be assured that the chemical and physical properties necessary for safe operation of the materials of flowmeter sensor components coming into contact with these will not be adversely affected during the operating period.
- Media containing chloride in particular can cause corrosion damage to stainless steels which, although not visible externally, can damage wetted parts beyond repair and lead to the measuring medium escaping. It is the operator's responsibility to check the suitability of these materials for the respective application.
- Measuring media with unknown properties or abrasive measuring media may only be used if the operator can perform regular and suitable tests to ensure the safe condition of the meter.

## 1.4 Improper use

The following are considered to be instances of improper use of the device:

- For operating as a flexible adapter in piping, e.g. for compensating pipe offsets, pipe vibrations, pipe expansions, etc.
- For use as a climbing aid, e.g. for mounting purposes
- For use as a support for external loads, e.g. as a support for piping, etc.
- Material application, e.g. by painting over the housing, name plate or welding/soldering on parts.
- Material removal, e.g. by spot drilling the housing.

## 1.5 Notes on data security

This product is designed to be connected to and to communicate information and data via a network interface. It is operator's sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). Operator shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and / or theft of data or information. ABB Automation Products GmbH and its affiliates are not liable for damages and / or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and / or theft of data or information.

## 1.6 Warranty provisions

Using the device in a manner that does not fall within the scope of its intended use, disregarding this manual, using underqualified personnel, or making unauthorized alterations releases the manufacturer from liability for any resulting damage. This renders the manufacturer's warranty null and void.

# 2 Function and system design

## 2.1.2 Process connections

Fig. 2: Pipe components (examples)

Pipe components

FMT091 – Wafer type design

In accordance with EN 092-1: DN 40 ... 200, PN 40
In accordance with ASME B16.5: 11/2 ... 8 in., CL 150 ... 300

FMT092 – Partial measuring section

Flange in accordance with EN 1092-1, DN 40 ... 100 (larger nominal diameters on request), PN 10 ... 40.

Flange in accordance with ASME B16.5: 11/2 ... 8 in., CL 150 ... 300

Male thread DN 25 ... 80 R1 ... 3 in.

FMT094 – Weld-on adapter

For rectangular ducts or pipe diameters ≥ DN 100 (4 in.), PN 16 ... 40

Wetted materials

Stainless steel, galvanized steel (other materials on request)

#### 2.2 Device description

The SensyMaster FMT230, FMT250 works in accordance with the measuring principle of a hot-film anemometer. This measurement method allows for direct measurement of the gas mass flow.

Taking into account the standard density, the norm volume flow can be displayed without the need for additional pressure and temperature compensation.

The device is equipped with a Modbus interface and two fast digital outputs that can be configured as pulse, frequency or binary outputs.

The SensyMaster FMT230, FMT250 is used in the process industry for the flow measurement of gases and gas mixtures.

Fig. 3: Sensor (example, wafer type design)

(A) Sensor (B) Pipe component (C) Sensor with pipe component

(1) Transmitter (2) Sensor connection (3) Thermal measuring element

The SensyMaster FMT230, FMT250 is composed of the components sensor and pipe component (process connection). The pipe component can be delivered in various designs. In addition, a welding adapter makes it possible to install the sensor in rectangular ducts or pipelines with any diameter.

#### 2.3 Measuring principle

Thermal flow metering procedures use different ways to evaluate the flow dependent cooling of a heated resistor as measuring signal.

In a hotfilm anemometer with constant temperature difference control, the heated platinum resistor is maintained at a constant overtemperature in relation to an unheated platinum sensor inside the gas flow.

The heating power required for maintaining the overtemperature depends directly on the flow rate and the material properties of the gas. With a known (and constant) gas composition the mass-flow can be determined by electronically evaluating the heater current / mass-flow curve without additional pressure and temperature compensation.

Together with the standard density of the gas this results directly in the standard volume flow.

Considering the high measuring range dynamics up to 1:100, an accuracy smaller than 1 % of the measuring value is achieved.

Fig. 4: Measuring principle (simplified)

(1) Transmitter (2) Measurement resistor gas temperature (3) Heat resistor

The transmitter has three signals available. In addition to the heating power, the temperatures of the measuring medium and the heater resistance are included herein, which can be used to compensate the temperature dependency of gas parameters. By storing the gas data in the transmitter the optimal tailoring can be calculated and performed at any operating point.

## 3 Product identification

# 4 Transport and storage

## 4.1 Inspection

Check the devices immediately after unpacking for possible damage that may have occurred from improper transport. Details of any damage that has occurred in transit must be recorded on the transport documents.

All claims for damages must be submitted to the shipper without delay and before installation.

## 4.2 Transport

## **⚠** DANGER

Life-threatening danger due to suspended loads.

In the case of suspended loads, a danger of the load falling exists.

Remaining under suspended loads is prohibited.

## **⚠** WARNING

Risk of injury due to device slipping.

The device's center of gravity may be higher than the harness suspension points.

- Make sure that the device does not slip or turn during transport.
- Support the device laterally during transport.

#### 4.3 Storing the device

Bear the following points in mind when storing devices:

- Store the device in its original packaging in a dry and dustfree location.
- Observe the permitted ambient conditions for transport and storage.
- Avoid storing the device in direct sunlight.
- In principle, the devices may be stored for an unlimited period. However, the warranty conditions stipulated in the order confirmation of the supplier apply.

Observe the following instructions:

- Do not expose the device to humidity during transport.
   Pack the device accordingly.
- Pack the device so that it is protected against vibrations during transport, e.g., by using air-cushioned packaging.

If the original packaging material is no longer available, wrap the device in bubble wrap or corrugated cardboard and place it in a box of sufficient size lined with a shock-absorbing material (e.g., foam rubber). The thickness of the padding should be appropriate for the device weight and type of shipment. The box must be labeled as "fragile".

For overseas shipment, always add a desiccant (e.g., silica gel) and hermetically seal the device plus desiccant in a layer of polythene that is 0.2 mm thick. Use an amount of desiccant that is appropriate for the packing volume and the expected transport time (at least for three months). You should also line the box with a layer of union paper.

# 4.3.1 Ambient conditions Storage temperature range

-25 ... 85 °C (-13 ... 185 °F)

## **Relative humidity**

Maximum 85 % RH, annual average ≤ 65 % RH

## 4.4 Returning devices

For the return of devices, follow the instructions in the chapter 'Returning devices' on page 79.

## 5 Installation

## **⚠** DANGER

## Danger to life due to piping under pressure!

Sensors which may eject during installation or removal in piping remaining under pressure may pose a danger to life.

- Install or remove a sensor only if the piping is depressurized.
- As an alternative, use a pipe component with an integrated replacement device.

## ♠ WARNING

## Risk of injury due to process conditions.

The process conditions, e.g. high pressures and temperatures, toxic and aggressive measuring media, can give rise to hazards when working on the device.

- Before working on the device, ensure that the process conditions do not pose any safety risks.
- If necessary, wear suitable personal protective equipment when working on the device.
- Depressurize and empty the device / piping, allow to cool and purge if necessary.

#### 5.1 Installation conditions

## 5.1.1 Installation location and assembly

Note the following points when selecting the installation location and when mounting the sensor:

- The ambient conditions (IP rating, ambient temperature range T<sub>amb</sub>) of the device must be adhered to at the installation location.
- Sensors and transmitters must not be exposed to direct sunlight. If necessary, provide a suitable means of sun protection on site. The limit values for the ambient temperature T<sub>amb</sub> must be observed.
- On flange devices, ensure that the counterflanges of the piping are aligned plane parallel. Only install flange devices with suitable gaskets.
- Prevent the sensor from coming into contact with other objects.
- The device is designed for industrial applications.
   No special EMC protective measures are required if the electromagnetic fields and interference at the installation location of the device comply with "Best Practice" guidelines (in accordance with the standards referred to in the declaration of conformity).
  - Maintain a suitable distance from electromagnetic fields and interference that extend beyond the usual dimensions.

#### Gaskets

Users are responsible for selecting and mounting suitable gaskets (material, shape).

Note the following points when selecting and mounting gaskets:

- Only gaskets made from a material that is compatible with the measuring medium and measuring medium temperature may be used
- Gaskets must not extend into the flow area, since possible turbulence may influence the accuracy of the device.

#### 5.1.2 Inlet and outlet sections

The figures below show the recommended inlet and outlet sections for various installations.

Fig. 6: Inlet and outlet sections

| Installation            | Inlet section | Outlet section |
|-------------------------|---------------|----------------|
| A Pipe extension        | min. 15 x DN  | min. 5 x DN    |
| B Pipe reduction        | min. 15 x DN  |                |
| © 90° Pipe elbow        | min. 20 x DN  |                |
| D 2 x 90° Pipe elbow in | min. 25 x DN  |                |
| one level               |               |                |
| E 2 x 90° Pipe elbow in | min. 40 x DN  |                |
| two levels              |               |                |
| F Turn-off device       | min. 50 x DN  |                |

To achieve the specified measuring accuracy, the indicated inlet and outlet sections are required.

In case of combinations of several inlet-side errors, e.g. valve and reduction, a longer inlet section must always be taken into account.

In case of confined spaces at the installation place, the outlet section can be reduced to 3 x DN. However, reducing the specified inlet section will reduce the achievable level of accuracy.

A high repeatability of the measured value is maintained. In case of insufficient inlet and outlet sections, a special calibration may be possible. To do this, a detailed alignment is necessary for individual cases.

The specified inlet and outlet sections must be doubled for gases with a very low density (hydrogen, helium).

## 5.1.3 Installation at high ambient temperatures

Fig. 7: Mounting position at high ambient temperatures

Under high but permissible ambient temperatures, avoid additional thermal stress from heat convection or radiation, since these sources of heat may exceed the permissible ambient temperature on the equipment surface. If the device needs to be installed directly on a hot, horizontal piping, we recommend installing it on the side. In such cases, you should avoid installing it in the 12 o'clock position, otherwise the warm air that rises up will cause additional heating of the electronics.

## 5.1.4 Sensor insulation

Fig. 8: Insulation of the sensor 1 Insulation

The sensor may be insulated as shown in Fig. 8.

## 5.2 Environmental conditions

## 5.2.1 Ambient temperature

- Standard: -20 ... 70 °C (-4 ... 158 °F)
- Extended TA9: -40 ... 70 °C (-40 ... 158 °F)
- Extended TA6: -50 ... 70 °C (-58 ... 158 °F)

## **Relative humidity**

Maximum 85 % RH, annual average ≤ 65 % RH

## IP rating

In accordance with EN 60529: IP 65 / IP 67

## 5.2.2 NEMA rating

NEMA 4X

#### 5.3 Process conditions

## 5.3.1 Measuring medium temperature

Devices with ceramic element and flange connection

- Standard: -25 ... 150 °C (-13 ... 302 °F)
- Extended (optional, only FMTx50):
- -25 ... 300 °C (-13 ... 572 °F)

The approved measuring medium temperature  $T_{\text{medium}}$  also depends on the selected sensor process connection and the design of the pipe components.

The following temperature specifications apply:

| Sensor connection               | T <sub>medium</sub>                |  |
|---------------------------------|------------------------------------|--|
| Threaded connection DIN 11851   | -40 140 °C (-40 284 °F)            |  |
| Clamp ring fitting              | -25 140 °C (-13 284 °F)            |  |
| Pipe components with ball valve | Maximum 150 °C (302 °F)            |  |
| Integrated hot tap fitting      | See the chapter titled 'Integrated |  |
|                                 | hot tap fitting' on page 15        |  |

#### Maximum operating pressure

Standard for devices with flange connection, P<sub>medium</sub>: 4 MPa, 40 bar (580 psi)

The approved operating pressure  $P_{\rm medium}$  also depends on the selected sensor process connection and the design of the pipe components.

The following temperature specifications apply:

| Sensor connection             | P <sub>medium</sub>                |
|-------------------------------|------------------------------------|
| Threaded connection DIN 11851 | 1.6 MPa, 16 bar (232 psi)          |
| Clamp ring fitting            | 2 MPa, 20 bar (290 psi)            |
| Integrated hot tap fitting    | See the chapter titled 'Integrated |
|                               | hot tap fitting' on page 15        |

#### **Pressure drop**

Fig. 9: Pressure loss in logarithmic representation  $\widehat{(A)}$  Pressure loss  $\widehat{(B)}$  Mass flow

# 5.3.2 Material loads for process connections DIN and ASME flanges

Fig. 10: DIN flange process connection

Fig. 11: ASME flange process connection

The maximum approved operating pressure for CL 300 is limited to 40 bar (580 psi).

#### Integrated hot tap fitting

Fig. 12: Maximum pressure / temperature values for integrated hot tap fitting

## 5.4 Assembly of the pipe component

When installing the pipe components, observe the following points:

- During installation, it is important to ensure that the flow direction corresponds to the attached label.
- When welding the welding adapter, remember to observe the relevant welding instructions. The amount of heat introduced must be kept to an absolute minimum to prevent warping of the mounting flange's sealing surface.
- In the case of flanged connections, flat gaskets must be installed, which should be in perfect condition and resistant to the measuring media.
- Before installing pipe components or sensors, check all components and gaskets for damage.
- Pipe components must not be installed under tension, otherwise the pipeline may exert impermissible forces on the device.
- When assembling the flanged connections, use screws that offer the required strength and dimensions.
- The screws must be tightened evenly and to the required torque.
- Once the pipe components have been installed, the insertion connection must be sealed by means of a blind flange plus gasket or by closing a shut-off device (if present).

# 5.4.1 Wafer type design (FMT091) and partial measuring section (FMT092)

Fig. 13: Installing a pipe component (example, wafer type design)

(1) Flange screw (2) Washer (3) Flange (4) Flange gasket (5) Pipe component (6) Sensor connection flange (7) Centering pin, outflow side (8) Nut

# Installation of the FMT091 pipe component (wafer type design) and FMT092 (partial measuring section).

- Position the pipe component coplanar and centered between the piping. The flow direction must correspond to the arrow indicated on the pipe component. The centering pin on the pipe component must be located on the outflow side (behind the measuring point).
- 2. Install gaskets between the sealing surfaces.

#### NOTICE

For achieve the best measurement results, make sure the gaskets fit concentrically with the pipe component.

- The inside diameter of the pipe and flange must precisely match in the wafer type design. Any differences in levels or edges, or untidy weld seams, will reduce the measuring accuracy.
- To guarantee that the flow profile is not distorted, the gaskets must not protrude into the piping.
- 3. Use the appropriate screws for the holes.
- 4. Slightly grease the threaded nuts.
- 5. Tighten the nuts in a crosswise manner as shown in the figure. First tighten the nuts to approx. 50 % of the maximum torque, then to 80 %, and finally a third time to the maximum torque.

## **İ** NOTICE

Torques for screws depend on temperature, pressure, screw and gasket materials. The relevant applicable regulations must be taken into consideration.

Fig. 14: Tightening sequence for the flange screws

#### 5.4.2 Weld-on adapter

Consider the following points when installing the welding dater in the piping:

After welding, the welding adapter must have a length of L
 (see chapter 'Mounting dimensions – welding adapter with
 flange and with and without ball valve' on page 18 and
 'Assembly dimension - welding adapter with threaded
 connection in accordance with DIN 11851' on page 19 ).

$$L = h - (1/2 \times D)$$

- L Length of the welding adapter
- h Installation length of the sensor
- D Outside diameter of the pipeline
- Shorten the length of the welding adapter as needed before welding it on. After welding, the welding adapter may protrude into the piping no more than 10 mm (0.39 inch).
- Observe thickness of pipeline wall and degree of shrinkage when welding!
- The distance h from the upper edge of the adapter flange to the pipe central axis must be within a tolerance of ± 2 mm (0.08 inch).
- Maintain a right angle to the pipe axis (max. tolerance 2°).
- The adapter centering pin must be aligned with the pipe axis in the flow direction (outflow side, behind the measuring point).
- Once welding is complete, there must be free clearance of at least 28 mm (1.10 inch) to install the sensor; drill to create clearance as needed.

#### Additional instructions for welding adapter with ball valve

## 1

## **⚠** DANGER

## Danger to life due to improper installation!

During welding, the gaskets in the ball valve may overheat. This can lead to the measuring medium escaping in an uncontrolled manner. This can result in severe injuries or death.

Remove the ball valve before welding.

Versions featuring a ball valve enable the flowmeter sensor to be installed and disassembled at low gauge pressures in the pipeline with minimal gas leakage.

The design with ball valve is installed as described above, but the following indications must be observed in addition:

- To install the sensor, the ball valve must be opened completely. Then, the flowmeter sensor can be installed along with the appropriate gasket and screwed into place.
- Before disassembling the sensor, make sure that the pipeline has been depressurized. Then, you can release the screws on the flange, remove the flowmeter sensor and close the ball valve.

## NOTICE

## Damage to the sensor.

Closing the ball valve before you remove the sensor can seriously damage the protective cage or the sensor elements. Do not close the ball valve until the flowmeter sensor has been removed.

# $\label{eq:mounting-dimensions-welding-adapter-with-flange-and-with-and-without-ball-valve-dimensions-welding-adapter-with-flange-and-with-and-without-ball-valve-dimensions-welding-adapter-with-flange-and-with-and-without-ball-valve-dimensions-welding-adapter-with-flange-and-with-and-without-ball-valve-dimensions-welding-adapter-with-flange-and-with-a$

## Without ball valve

## With ball valve

Fig. 15: Welding adapter with flange - all dimensions given in mm (inch).

(1) Centering pin (2) Nut for O-ring (3) connection flange DN 25 (1") (4) flow direction

| h – sensor length | Ø D – outer pipe diameter (min. / max.) |  |  |
|-------------------|---|--|--|
|                   | Without ball valve                      | With ball valve                          |  |
| 263 (10.35)       | 100 350 (3.94 13.78)                    | 100 150 (3.94 5.91)                      |  |
| 425 (16.73)       | > 350 700 (> 13.78 27.56)               | > 150 500 (> 5.91 19.69)                 |  |
| 775 (30.51)       | > 700 1400 (> 27.56 55.12)¹)            | > 500 1150 (> 19.69 45.28) <sup>1)</sup> |  |

<sup>1)</sup> The limitation of the maximum pipe diameter only applies for installations with a measuring element in the middle of the pipe. In case of larger or non-round cross-sections, a non-centered position of the measuring element in the piping is considered in the calibration.

## Assembly dimension - welding adapter with threaded connection in accordance with DIN~11851

Fig. 16: Dimensions in mm (inch)

(1) Union nut (2) Flow direction (3) Centering pin

## 5.4.3 Integrated hot tap fitting

## Wafer type design

Installation of the wafer type design is performed as explained in chapter 'Assembly of the pipe component' on page 15.

## Welding design

## Danger to life due to improper installation!

Do not shorten hot tap fitting components or interfere with the design. This can lead to the measuring medium escaping in an uncontrolled manner. This can result in severe injuries or death.

The welding version of the integrated changing device is available in two installation lengths:

- for nominal diameters DN 100 ... DN 125 (4 ... 5") and
- for nominal diameters DN 150 ... DN 300 (6 ... 12")

#### **İ** NOTICE

- The sensor length h is 425 mm (16.73 inch) respectively.
- The installation depth Y depends on the pipe diameter and must be calculated individually.

Fig. 17: Integrated changing device in measurement position, dimensions in mm (inch)

(1) Sensor (2) Centering pin (3) Flow direction

## Calculation of the outside length X and installation depth Y

$$X = h - (D/2)$$
  
 $Y = (D/2) - 28 \text{ mm} (1.1 \text{ inch})$ 

- X Outside length of the integrated changing device
- Y Installation depth of the integrated changing device
- h Sensor length
- D Outside diameter of the pipeline

#### Example

- Sensor length h = 425 mm (16.73 inch)
- Pipe with external diameter of 210 mm (8.27 inch)
- The changing device is in measurement position

X = 425 mm - (210 mm / 2) = 320 mm

Y = (210 mm / 2) - 28 mm = 77 mm

Consider the following points when installing the welding version in the piping:

- Maintain a right angle to the pipe axis (max. tolerance 2°).
- The adapter centering pin must be aligned with the pipe axis in the flow direction (outflow side, behind the measuring point).

## **1** NOTICE

#### Damage to components

If the welded joints become hot, warping of the sealing surfaces and / or damage to the O-rings can occur. Pause occasionally to allow the fitting to cool.

## i NOTICE

## Impact on measuring accuracy

Deviations from the stated dimension and position tolerances have an impact on measuring accuracy.

#### 5.5 Installing the sensor

When installing the sensor, observe the following points:

- Installation in the pipe component or welding adapter is only possible if the sensor data matches the measuring point specifications.
- The sensor may be sealed only by using the O-ring supplied in the scope of delivery. The O-ring must be placed in the designated groove on the sensor connection flange.
- The measuring elements may not be damaged when inserting the sensor into the pipe component.
- If you are using an integrated changing device, you must check that the changing device is in the disassembly position before releasing the mounting screws.

## 5.5.1 Wafer type design and welding adapter

Fig. 18: Installing a sensor (example)

(1) Sensor (2) Flange screws (3) O-Ring (4) Sensor connection flange
(5) Centering pin (6) Washers and nuts

## Installing the sensor:

- 1. Place the supplied O-ring in the groove of the sensor connection flange.
- 2. Carefully slide the sensor into the pipe component. Observe correct alignment to the centering pin in the process
- Fasten the sensor to the sensor connection flange using screws. Tighten the flange screws simultaneously by applying the required torque (torque for supplied screws, non-lubricated, without use of spring washers: 87 Nm).

# 5.5.2 Installation / Disassembly in connection with the changing device

## DANGER

## Danger to life due to piping under pressure!

If the changing device is in the measurement position during disassembly of the sensor, this may pose a danger to life due to the possibility of the sensor being ejected.

Disassemble the sensor only if the changing device is in the disassemble position.

## **A** DANGER

## Danger to life due to leaking measuring medium!

If the changing device is in the measurement position during disassembly of the sensor or gaskets in the changing device are damaged, leaking measuring medium may pose a danger to life.

- Make sure that the changing device is in the disassemble position.
- If measuring medium should start to leak in spite of this, immediately stop disassembly of the sensor and tighten the fastening screws.
- Drain and rinse the piping before disassembling the sensor, check and repair the changing device.

## **CAUTION**

## Risk of injury due to leaking measuring medium!

When you disassemble the transmitter, small quantities of measuring medium may leak due to the nature of the design. Make sure that sufficient ventilation is ensured during disassembly of the sensor.

## NOTICE

## Damage to the changing device

Using tools or other devices to operate the lock nut can damage the hot tap fitting.

Only ever operate the lock nut manually.

Fig. 19: Sensor process connection

(1) O-Ring (2) Connection flange (3) Centering pin (4) Screws to secure the guiding pipe (5) union nut

Fig. 20: Sensor Installation / Disassembly

- (A) Integrated changing device in disassemble position (B) integrated changing device in measurement position
- (1) Sensor (2) Protection cap (3) Union nut in disassemble position (4) Union nut in measurement position (5) Special screws for protection cap

## Installation of the sensor during operation

## NOTICE

The changing device must be in the disassemble position before disassembling the sensor, the sensor process connection is sealed.

## Installing the sensor:

- 1. Place the supplied O-ring in the groove of the sensor connection flange.
- 2. Carefully slide the sensor into the changing device. Observe correct alignment to the centering pin in the process.
- 3. Fasten the sensor to the sensor connection flange using screws. Use the supplied M12 screws, as well as two extended special screws for this.
- 4. Place the protection caps onto the special screws and tighten using two nuts.
- 5. Twist the transmitter with the union nut into the measuring position. The lower edge of the union nut indicates the position of the sensor. Only when the measuring position is reached 50 OPEN MESSEN (the lower limit stop of the union nut) will the sensor be in the middle of the piping and precise values can be provided.
- 6. Carry out the electrical connection

## Disassembly of the sensor during operation

Disassembly of the sensor:

- Twist the transmitter with the union nut into the disassemble position. The lower edge of the union nut indicates the position of the sensor. Only when the disassemble position is reached 0 - CLOSE - ZU (the upper limit stop of the union nut) will the sensor be in the disassemble position and the changing device is sealed off from the process.
- 2. Disconnect electrical connections.
- 3. Remove protection caps.
- 4. Remove flange screws.
- 5. Carefully pull the sensor out of the changing device (do not tip to the side).

## 5.6 Opening and closing the housing

## WARNING

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

Fig. 21: Cover safety device (example)

To open the housing, release the cover safety device by screwing in the Allen screw (1).

After closing the housing, lock the housing cover by unscrewing the Allen screw (1).

## **İ** NOTICE

## Potential adverse effect on the IP rating

- Make sure that the cover of the power supply terminals is mounted correctly.
- Check the O-ring gasket for damage and replace it if necessary before closing the housing cover.
- Check that the O-ring gasket is properly seated when closing the housing cover.

## 5.7 Electrical connections

## **⚠** WARNING

Risk of injury due to live parts.

Improper work on the electrical connections can result in electric shock.

- Connect the device only with the power supply switched off.
- Observe the applicable standards and regulations for the electrical connection.

The electrical connection may only be established by authorized specialist personnel and in accordance with the connection diagrams.

The electrical connection information in this manual must be observed; otherwise, the IP rating may be adversely affected. Ground the measurement system according to requirements.

## 5.7.1 Installing the connecting cables

Ensure that a drip loop (water trap) is used when installing the connecting cables for the sensor.

Fig. 22: Laying of the connecting cable 1 Drip loop

## 5.7.2 Electrical connection

Fig. 23: Electrical connection
PA = Functional ground (potential equalization)

| Output "closed"                                  | 0 V ≤ U <sub>CEL</sub> ≤ 3 V              |  |  |
|  | 2 mA ≤ I <sub>CEL</sub> ≤ 30 mA           |  |  |
| Output "open"                                    | 16 V ≤ U <sub>CEH</sub> ≤ 30 V DC         |  |  |
|  | 0 mA ≤ I <sub>CEH</sub> ≤ 0.2 mA          |  |  |
| Switching function Can be configured via Modbus. |   |  |  |
|  | See chapter 'Parameter range - Output' on |  |  |
|  | page 57.                                  |  |  |

## **İ** NOTICE

 Terminals 42 / 52 have the same potential. Digital outputs 41 / 42 and 51 / 52 are not electrically isolated from each other.

## 5.7.4 Modbus protocol

## NOTICE

The Modbus protocol is not secure, as such the intended application should be assessed to ensure that these protocols are suitable before implementation.

Modbus is an open standard owned and administrated by an independent group of device manufacturers styled the Modbus Organization (www.modbus.org).

Using the Modbus protocol allows devices made by different manufacturers to exchange information via the same communication bus, without the need for any special interface devices to be used.

Fig. 25: Communication via the Modbus protocol

(1) Modbus master (2) Terminating resistor (3) Modbus slave 1

(4) Modbus slave n ... 32

| Modbus protocol       |  |  |  |

| IEEE format           | Little endian, big endian                    |  |  |
|                       | Factory setting: Little endian               |  |  |
| Typical response time | < 100 ms                                     |  |  |
| Response delay        | 0 200 milliseconds                           |  |  |
| (Response Delay       | Factory setting: 10 milliseconds             |  |  |
| Time)                 |  |  |  |

#### Modbus response time

The typical response time of the device is normally less than 100 ms (minimum response time). The response time is calculated from the end of the request telegram from the master to the beginning of the response telegram from the slave.

The response time can be increased via the parameter "modbusResponseDelayTime".

See Chapter 'Parameter range – Communication' on page 62. The length of the response telegram is dependent upon the number of bytes read and the baud rate configured.

## Cable specification

The maximum permissible length is dependent on the baud rate, the cable (diameter, capacity and surge impedance), the number of loads in the device chain, and the network configuration (2-core or 4-core).

- At a baud rate of 9600 and with a conductor cross section of at least 0.14 mm<sup>2</sup> (AWG 26), the maximum length is 1000 m (3280 ft).
- When using a 4-core cable as a 2-wire wiring system, the maximum length must be halved.
- The spur lines must be short, a maximum of 20 m (66 ft).
- When using a distributor with "n" connections, each branch must have a maximum length of 40 m (131 ft) divided by "n".

The maximum cable length depends on the type of cable used. The following standard values apply:

- Up to 6 m (20 ft):
   cable with standard shielding or twisted-pair cable.
- Up to 300 m (984 ft): double twisted-pair cable with overall foil shielding and integrated earth cable.
- Up to 1200 m (3937 ft): double twisted-pair cable with individual foil shielding and integrated earth cables. Example: Belden 9729 or equivalent cable.

A category 5 cable can be used for Modbus RS485 up to a maximum length of 600 m (1968 ft). For the symmetrical pairs in RS485 systems, a surge impedance of more than 100  $\Omega$  is preferred, especially at a baud rate of 19200 and above.

## 5.7.5 Connection on the device

Fig. 26: Connection to the device (example), dimensions in mm (inch) PA = potential equalization

Connect the compact design: Perform steps A ... C. During the process, observe the following instructions:

- Lead the cable for the power supply into the terminal box through the left cable entry.
- Lead the cables for the modbus outputs and digital outputs into the terminal box through the right cable entry.
- Connect the cables in accordance with the electrical connection diagram. Connect the cable shields to the designated grounding clamp in the terminal box.
- Connect the potential equalization (PE) on the ground terminal to the terminal box.
- Use wire end ferrules when connecting.

## **İ** NOTICE

If the O-ring gasket is seated incorrectly or is damaged, this may have an adverse effect on the IP rating.

Check the O-ring gasket for damage and replace it if necessary before closing the housing cover.

Check that the O-ring gasket is properly seated when closing the housing cover.

Observe the following points when connecting to the power supply:

- Adhere to the limit values of the power supply according to the information on the device identification plate.
- The leads must comply with IEC 227 and/or IEC 245.
- Complete the electrical connection according to the electrical plan.

# 6 Commissioning and operation

# 6.1 Write-protection switch, service LED and local operating interface

Fig. 27

(1) Write protection switch (2) Service LED (3) Local operating interface

## Write protection switch

The write protection switch is located in the sensor terminal box.

If write protection is active, the parameterization of the device cannot be changed via Modbus or the local operating interface. Turning the write protection switch clockwise deactivates the write protection function, while turning the switch counterclockwise activates it.

#### **Service LED**

The service LED, which indicates the operating condition of the device, is located in the sensor terminal box.

| Service LED   | Description                                |  |
|---|--|--|
| Flashes rapidly Starting sequence, device not yet ready |  |  |
| (100 ms)  | operation                                  |  |
| Lit up continuously                                     | Device operating, no critical error        |  |
| Flashes slowly  | A critical error has occurred, see chapter |  |
| (1 second)  | 'Parameter range – Diagnostics' on page 63 |  |

#### Local operating interface

The sensor can also be parameterized without a Modbus connection via the local operating interface, see chapter 'Parameterization via the local operating interface' on page 30 .

## 6.2 Checks prior to commissioning

The following points must be checked before commissioning the device:

- The wiring must have been completed as described in the chapter 'Electrical connections' on page 24.
- The correct grounding of the sensor.
- The ambient conditions must meet the requirements set out in the technical data.
- The power supply must meet the requirements set out on the identification plate.

## **İ** NOTICE

## Damage of the device due to undervoltage!

In case of lower voltage than defined on the type plate, the current draw of the device device increases.

Thus, the internal fuses may be damaged.

## 6.3 Switching on the power supply

- 1. Switch on the power supply.
- 2. Carry out parameterization of the flowmeter (see chapter 'Parameterization of the device' on page 29).

The flowmeter is now ready for operation.

## 6.3.1 Inspection after switching on the power supply

The following points must be checked after commissioning the device:

 The parameter configuration must correspond to the operating conditions.

#### 6.4 Parameterization of the device

#### **İ** NOTICE

The device does not have operating elements for parameterization on site.

The parameterization is performed either via the Modbus interface or the local operating interface of the device.

Usually at least the following parameters must be set during commissioning:

- The Modbus slave ID, baud rate, and parity,
- Units for mass flow, standard volume flow, standard density and temperature.
- The pulse width and the pulse factor for the pulse output,
- Low flow cut-off.

The settings for the Modbus interface and the pulse output are only necessary if the corresponding outputs are also used.

## 6.4.1 Parameterization via the Modbus interface

Note chapter 'Interface description' on page 31 when parameterizing the Modbus interface.

#### Factory setting for the Modbus slave ID (address)

The Modbus Slave ID of the device is preset at the factory. The Modbus Slave ID corresponds to the last two digits of the serial number of the device on the name plate.

Fig. 28: Modbus address on the name plate (example)

(1) Serial number (2) Modbus Slave ID

#### Changing an unknown Modbus slave ID

The Modbus Slave ID (address) of the device must be known for Modbus communication.

Upon delivery, the Modbus Slave ID corresponds to the last two digits of the serial number of the device (see chapter 'Parameterization via the Modbus interface' on page 29 ). If the Modbus address is not known, the Modbus Slave ID can be reset via a Modbus broadcast message. To do this, the following three Modbus registers must be sent to the bus together with the function code 16 (0x10) "Write Multiple Registers".

| Address / data type                     | Description                                |
|---|--|
| [register length]                       |  |
| 65521 TUSIGN32 [2] manufacturerDeviceID |  |
|   | The manufacturer code (ABB = 0x1A) and     |
|   | the device code (FMT2xx = 0x27) must be    |
|   | written to the register 65522.             |
| 65523 TUSIGN32 [2]                      | sensorSerialID                             |
|   | The Sensor ID of the device (on the        |
|   | calibration certificate). The information  |
|   | must first be written in the high-byte     |
|   | (65524) of the register.                   |
| 65525 TUSIGN32 [2]                      | slaveID                                    |
|   | The new Modbus Slave ID must be written in |
|   | the high byte (65526) of the register.     |

The three Modbus registers must now be sent from the Modbus master to the broadcast address "O". All of the devices connected to the bus receive the message, but only the device addressed via the manufacturer code and the Sensor ID sets the Modbus Slave ID to the new required value.

Fig. 29: Write Multiple Registers (example)

- 1 Function code 16 2 Broadcast Address "0"
- (3) Register start address (4) Register number
- (5) Manufacturer and device identification (6) Sensor ID
- (7) New Modbus Slave ID

C1238

## 6.4.2 Parameterization via the local operating interface

## **⚠** DANGER

# Risk of explosion during operation of the device with open terminal box!

Only perform parameterization of the device via the local operating interface outside the potentially explosive area!

A PC / notebook and the USB interface cable (3KXS310000L0001) are required to configure the device via the device's local operating interface.

In conjunction with the HART-DTM and the software "ABB AssetVision" available at www.abb.com/flow, all parameters can also be set without a Modbus connection.

Fig. 30: Connection to the local operating interface

- 1 Local operating interface 2 Programming plug
- (3) PC / notebook (4) USB interface cable
- 1. Open device terminal box.
- 2. Connect programming plug to the local operating interface of the device.
- Insert USB interface cable into a free USB female connector on the PC / notebook.
- 4. Switch on the device power supply.
- Start ABB AssetVision and perform the parameterization of the equipment.

Detailed information on operating the software is available in the relevant operating instructions and the DTM online help.

#### 6.5 Operating instructions

When operating the device, please note the following:

- Aggressive or corrosive media may lead to the damage of wetted parts of the sensor. As a result, measuring medium under pressure can leak out.
- Measuring medium under pressure can leak out due to fatigue on the gasket of the sensor connection or the process connection (e.g. flange or pipe fitting).

If there is a chance that safe operation is no longer possible, take the device out of operation and secure it against unintended startup.

## 6.6 Interface description

## NOTICE

All Modbus addresses in this chapter are indicated in the format "PLC Base 1".

## 6.6.1 Register tables (overview)

| Description   | Table type | Data type | Start index | End index |
|---|------------|-----------|-------------|-----------|
| Input coils   |            |           |             |           |

| Editable character strings                                    | String     | TCHAR     | 3401        | 4000      |
| 8-bit integer values, basis parameter                         | Single     | TUSIGN8   | 4001        | 4999      |
| 32-bit float values, basis parameter                          | Single     | TFLOAT    | 5001        | 5999      |
| Application 1 to 8: byte parameter                            | Single     | TUSIGN8   | 6001        | 6999      |
| Application 1 to 8: floating point parameter                  | Single     | TFLOAT    | 7001        | 8999      |
| Action objects  | Single     | TUSIGN8   | 9001        | 9999      |
| Set Modbus address (slave ID) with device code and sensor ID. | Single     | TUSIGN32  | 65521       | 65526     |
| See chapter 'Changing an unknown Modbus slave ID' on page 29. |            |           |             |           |

The device error messages are transmitted via the Modbus interface by means of the "input coils." See the chapter 'Diagnosis / error messages' on page 71 for detailed information.

## 6.6.2 Supported Modbus function codes

## Summary

The function codes listed below are supported by SensyMaster FMT230, FMT250.

| Function code | Description              | Applicable to register tables        |
|---------------|--------------------------|--------------------------------------|
| 0x02          | Read Discrete Inputs     | Alarm status Discrete Inputs         |
|               |                          | Alarm history status Discrete Inputs |
| 0x03          | Read Holding Registers   | Read-write Byte parameters           |
|               |                          | Read-write Byte string parameters    |
|               |                          | Read-write Float parameters          |
|               |                          | Action parameters                    |
| 0x04          | Read Input Registers     | Read-only Byte parameters            |
|               |                          | Read-only Short parameters           |
|               |                          | Read-only Integer parameters         |
|               |                          | Read-only Float parameters           |
|               |                          | Read-only Double parameters          |
|               |                          | Alarm history counters               |
|               |                          | Read-only Byte string parameters     |
| 0x06          | Write Single Register    | Read-write Byte parameters           |
|               |                          | Read-write Byte string parameters    |
|               |                          | Action parameters                    |
| 0x08          | Diagnostics              | NA                                   |
| 0x10          | Write Multiple Registers | Read-write Byte parameters           |
|               |                          | Read-write Byte string parameters    |
|               |                          | Read-write Float parameters          |
|               |                          | Action parameters                    |
| 0x11          | Report Slave ID          | NA                                   |

## 6.6.3 Modbus function codes

In this chapter, all Modbus function codes supported by SensyMaster FMT230, FMT250 are described.

## 0x02 Read Discrete Inputs

The "Read Discrete Inputs" function code is used to read off register "Discrete Inputs (Coil)" of the device. The query telegram is designed as follows:

| Byte | Description   |  |
|------|---|--|
| 1    | Slave device code   |  |
| 2    | Read Discrete Inputs Function Code, 0x02.   |  |
| 3, 4 | Discrete input address. 16-bit value indicating the address of the first discrete input to be read. |  |
| 5, 6 | Number of discrete inputs. 16-bit value indicating the number of discrete inputs to be read.        |  |
| 7, 8 | Check sum (CRC) of the Modbus telegram  |  |

The reply telegram to a successfully processed query is designed as follows:

| Byte      | Description   |  |
|-----------|---|--|
| 1         | Slave device code   |  |
| 2         | Read Discrete Inputs Function Code, 0x02.   |  |
| 3         | Anzahl (n) der Datenbytes im Antwort-Telegramm  |  |
| 4 (4+n)-1 | Discrete input data. Up to 2000 discrete inputs can be read in one request, if available. |  |
| (4+n),    | Check sum (CRC) of the Modbus telegram  |  |
| (4+n)+1   |   |  |

## 0x03 Read Holding Registers

The "Read Holding registers" function code is used to read off the "Read Holding Registers" of the device. The query telegram is designed as follows:

| Byte | Description  |  |
|------|--|--|
| 1    | Slave device code  |  |
| 2    | Read Holding Registers Function Code, 0x03.  |  |
| 3, 4 | Holding register address. 16-bit address indicating the address of the first holding register to read. |  |
| 5, 6 | Holding register count. 16-bit value indicating the number of holding registers to read.               |  |
| 7, 8 | Check sum (CRC) of the Modbus telegram   |  |

The reply telegram to a successfully processed query is designed as follows:

| Byte      | Description  |
|-----------|--|
| 1         | Slave device code  |
| 2         | Read Holding Registers Function Code, 0x03.  |
| 3         | Holding register count ('n'). 8-bit value indicating the count of holding registers returned in the message. |
| 4 (4+n)-1 | Holding register data.   |
| (4+n),    | Check sum (CRC) of the Modbus telegram   |
| (4+n)+1   |  |

## 0x04 Read Input Registers

The "Read Input Registers" function code is used to read off the "Input Register" of the device.

The query telegram is designed as follows:

| Byte | Description  |  |
|------|--|--|
| 1    | Slave device code  |  |
| 2    | Read Input Registers Function Code, 0x04.  |  |
| 3, 4 | Input register address. 16-bit value indicating the address of the first input register to read. |  |
| 5, 6 | Input register count. 16-bit value indicating the number of input registers to read.             |  |
| 7, 8 | Check sum (CRC) of the Modbus telegram   |  |

The reply telegram to a successfully processed query is designed as follows:

| Byte      | Description                                    |  |
|-----------|--|--|
| 1         | Slave device code                              |  |
| 2         | Read Input Registers Function Code, 0x04.      |  |
| 3         | Number (n) of data bytes in the reply telegram |  |
| 4 (4+n)-1 | Input register data.                           |  |
| (4+n),    | Check sum (CRC) of the Modbus telegram         |  |
| (4+n)+1   |  |  |

## 0x06 Write Single Register

The "Write Single Register" function code is used to write a value in one of the "Holding Register" of the device.

The query telegram is designed as follows:

| Byte | Description   |
|------|---|
| 1    | Slave device code   |
| 2    | Write Single Register Function Code, 0x06.                          |
| 3, 4 | 16-bit holding register address.                                    |
| 5, 6 | Holding register value. 16-bit value indicating the value to write. |
| 7, 8 | Check sum (CRC) of the Modbus telegram                              |

The reply telegram to a successfully processed query is designed as follows:

| Byte | Description   |
|------|---|
| 1    | Slave device code   |
| 2    | Write Single Register Function Code, 0x06.  |
| 3, 4 | Holding register address. 16-bit value indicating the address of the holding register that was written. |
| 5, 6 | Holding register value. 16-bit value indicating the value that was written to the holding register.     |
| 7, 8 | Check sum (CRC) of the Modbus telegram  |

## 0x08 Diagnostics

Only the subfunction "Return Query Data (0x00, 0x00)" is supported.

If the device receives a query telegram, the telegram is sent back to the Master without changes.

The query and reply telegrams are designed as follows:

| Byte     | Description                              |  |
|----------|--|--|
| 1        | Slave device code                        |  |
| 2        | Diagnostics Function Code, 0x08.         |  |
| 3, 4     | Sub-query identifier, 0x00, 0x00.        |  |
| 5(5+n)-1 | Diagnostics query data. (Of length 'n'). |  |
| (5+n)    | Check sum (CRC) of the Modbus telegram   |  |
| (5+n)+1  |  |  |

## 0x10 Write Multiple Registers

The "Write Multiple Register" function code is used to write a value in the "Holding Register" of the device.

The query telegram is designed as follows:

| Byte     | Description   |  |
|----------|---|--|
| 1        | Slave device code   |  |
| 2        | Write Multiple Registers Function Code, 0x10.   |  |
| 3, 4     | Holding register address. 16-bit value indicating the address of the first holding register to write. |  |
| 5, 6     | Holding register count. 16-bit value indicating the number of holding registers to write              |  |
| 7        | Byte count ('n'), number of data bytes in the request.  |  |
| 8(8+n)-1 | Holding register message data. The data to write to the holding registers.                            |  |
| (8+n)    | Check sum (CRC) of the Modbus telegram  |  |
| (8+n)+1  |   |  |

The reply telegram to a successfully processed query is designed as follows:

| Byte | Description  |
|------|--|
| 1    | Slave device code  |
| 2    | Write Multiple Registers Function Code, 0x10.  |
| 3, 4 | Holding register address. 16-bit value indicating the address of the first holding register. |
| 5, 6 | Holding register count. 16-bit value indicating the number of holding registers written.     |
| 7, 8 | Check sum (CRC) of the Modbus telegram   |

## 0x11 Report Slave ID

The "Report Slave ID" commando is used to uniquely identify the slave device.

The query telegram is designed as follows:

| Byte | Description                            |  |
|------|--|--|
| 1    | Slave device code                      |  |
| 2    | Report Slave ID Function Code, 0x11.   |  |
| 3, 4 | Check sum (CRC) of the Modbus telegram |  |

The reply telegram to a successfully processed query is designed as follows:

| Byte | Description   |  |
|------|---|--|
| 1    | Slave device code   |  |
| 2    | Report Slave ID Function Code, 0x11                                     |  |
| 3    | Number of data bytes  |  |
| 4    | Manufacturer identification for ABB 0x1A                                |  |
| 5    | Device code for SensyMaster devices, 0x27                               |  |
| 6    | Software version, 0x30  |  |
| 7    | Hardware version, 0x30  |  |
| 8    | Not used, 0x30  |  |
| 911  | Reserved for future use, 0x30,0x30,0x30                                 |  |
| 1233 | Device name   |  |
|      | (Hex) 41,42,42,20,46,4D,54,32,78,78,20,53,65,6E,73,79,4D,61,73,74,65,72 |  |
|      | (ASCII) "ABB FMT2xx SensyMaster"  |  |
| 3435 | Check sum (CRC) of the Modbus telegram                                  |  |

## 6.6.4 Modbus error handling (exception codes)

If the recipient of the message determines an error, it sends an appropriate error message back to the Master. Here the function code from query telegram 0x80 is added. An appropriate error code is sent as data. The following error codes are supported:

| Error code | Name                 | Description   |
|------------|----------------------|---|
| 0x01       | ILLEGAL_FUNCTION     | Use of an unsupported function code or the device currently cannot process the    |
|            |                      | query.  |
| 0x02       | ILLEGAL_DATA_ADDRESS | Invalid register address is used or an attempt has been made to write to a write- |
|            |                      | protected register address.   |
| 0x03       | ILLEGAL_DATA_VALUE   | Use of unauthorized data values, e.g. an incorrect number of registers.           |
| 0x04       | SLAVE_DEVICE_FAILURE | The device currently cannot process the query. Repeat the query later.            |

The reply telegram with error message is designed as follows:

| Byte | Description                            |
|------|--|
| 1    | Slave device code                      |
| 2    | Function code + 0x80                   |
| 3    | Error code (exception code)            |
| 4,5  | Check sum (CRC) of the Modbus telegram |

# 6.6.5 Modbus data types

| ABB data type | Data type      | Register count             | Description   |
|---------------|----------------|----------------------------|---|
| ACTION        | unsigned char  | One register               | The data type "ACTION" is used to trigger device functions.               |
|               |                |                            | Parameters with the data type "ACTION" have no internal memory            |
|               |                |                            | requirements. Writing any value into the parameters triggers the          |
|               |                |                            | corresponding device function.  |
| TUSIGN8       | unsigned char  | One register               | 16-bit register, but only the first 8-bits are used - unsigned char.      |
| TUSIGN16      | unsigned short | One register               | 16-bit unsigned integer   |
| TINT16        | signed short   | One register               | 16-bit signed integer   |
| TUSIGN32      | unsigned long  | Two consecutive registers  | 32-bit unsigned integer   |
| TINT32        | signed long    | Two consecutive registers  | 32-bit signed integer   |
| TCHAR         | unsigned char  | One register.              | 16-bit register, but only the first 8-bits are used - unsigned char. The  |
|               |                | The total length of the    | register content is interpreted as an ASCII-value.                        |
|               |                | register depends on the    |   |
|               |                | object length.             |   |
| TFLOAT        | float          | Two consecutive registers  | 32-bit IEEE floating point.   |
|               |                |                            | The device parameter "IEEEFormat" determines the order in which the       |
|               |                |                            | data words of the data types "float" and "double" are interpreted.        |
|               |                |                            | See also the chapter 'Parameter range – Communication' on page 62 .       |
| TDOUBLE       | double         | Four consecutive registers | 64-bit IEEE double-precision floating point.                              |
|               |                |                            | The device parameter "IEEEFormat" determines the order in which the       |
|               |                |                            | data words of the data types "float" and "double" are interpreted. See    |
|               |                |                            | also the chapter 'Parameter range – Communication' on page 62.            |
|               |                |                            | If the parameter is set to "1" (IEEE format deactivated), the data words  |
|               |                |                            | of the data types "float" and "double" are sent in the standard Modbus    |
|               |                |                            | format "big endian".  |
|               |                |                            | Example:  |
|               |                |                            | The value "5.525" is returned in hex as "40, 16, 19, 99, 99, 99, 99, 9A". |
|               |                |                            | If the parameter is set to "0" (IEEE format activated), the data words    |
|               |                |                            | of the data types "float" and "double" are sent in the format "little     |
|               |                |                            | endian" with the lowest value word first.                                 |
|               |                |                            | Example:  |
|               |                |                            | The value "5.525" is returned in hex as "99, 9A, 99, 99, 19, 99, 40, 16". |

#### 6.6.6 Available units

For certain parameters it is possible to choose among the following units.

### **İ** NOTICE

The "Code" column indicates the value to which the corresponding parameter must be set, e.g. using the communications interface.

Table 1: Units for the standard volume flow

| Table 1. Office for the standard volume now |      |                         |
|---|------|-------------------------|
| Selection                                   | Code | Description             |
| m <sup>3</sup> /s                           | 13   | Cubic meters per second |
| m <sup>3</sup> /min                         | 14   | Cubic meters per minute |

|                                | 153  | Natural gas <sup>2)</sup>                      |
| NH <sub>3</sub>                | 39   | Ammonia <sup>2)</sup>                          |
| He                             | 120  | Helium <sup>2)</sup>                           |
| Ar                             | 42   | Argon <sup>2)</sup>                            |
| C <sub>3</sub> H <sub>8</sub>  | 205  | Propane <sup>2)</sup>                          |
| C <sub>2</sub> H <sub>6</sub>  | 108  | Ethane <sup>2)</sup>                           |
| C <sub>4</sub> H <sub>10</sub> | 69   | Butane <sup>2)</sup>                           |
| C <sub>2</sub> H <sub>4</sub>  | 114  | Ethene <sup>2)</sup>                           |
| _                              | 48   | Biogas <sup>2)</sup>                           |

<sup>1)</sup> Gas type available in ApplicationSelector (preconfigured applications) and for three configurable applications.

<sup>2)</sup> Gas type available only for preonfigured applications.

#### 6.6.8 Available process variables

The process variables available in the software are listed in the table.

#### **İ** NOTICE

- Some of the process variables can be assigned to the digital outputs DO1 (terminals 41 / 42) and DO2 (terminals 51 / 52), configured as frequency [f] or pulse output [pulse].
  - (Code) indicates to which value the parameters "Output Value Freq." and "Output Value Pulse" must be set. See also chapter 'Parameter range Output' on page 57.
- The "Modbus address" column indicates the Modbus register address, data type and the register length for the corresponding process variable.

| Process variable                   | Short form | Description   | DO1 / 2    | DO1/2             | Modbus address       |             |
|------------------------------------|------------|---|------------|-------------------|----------------------|-------------|
|                                    |            |   | [f] (Code) | [pulse]<br>(Code) | TFLOAT [2]           | TDOUBLE [4] |
| Mass Flow [unit]                   | Qm         | Mass flow in the selected mass flow unit                  | _          | X (1)             | 201                  | _           |
| Mass Flow [%]                      | Qm         | Mass flow in percent                                      | X (1)      | -                 | 209                  | _           |
| Volume Flow @ [unit]               | Qv@        | Standard volume flow in the selected volume unit          | _          | X (2)             | 205                  | _           |
| Volume Flow @ [%]                  | Qv@        | Standard volume flow in percent                           | X (2)      | -                 | 213                  | _           |
| Temperature [unit]                 | Tm         | Temperature in the selected standard volume unit          | _          | -                 | 203                  | _           |
| Temperature [%]                    | Tm         | Temperature in percent                                    | X (3)      | -                 | 211                  | _           |
| Density @                          | p@         | Standard density in the selected density unit             | _          | -                 | 207                  | _           |
| Totalizer Qm                       | Σm         | Mass flow counter reading in the selected unit            | _          | -                 | 215                  | 409         |
| Totalizer Qv @                     | Σν@        | Standard volume flow counter reading in the selected unit | -          | -                 | 217                  | 413         |
| Current Batch Total <sup>1)</sup>  | СВТ        | Current fill quantity                                     | -          | -                 | 219                  | 405         |
| Current Batch Counts <sup>1)</sup> | СВС        | Number of fill operations                                 | -          | _                 | 3315<br>TUSIGN32 [2] | -           |

<sup>1)</sup> Process variable is only available if FillMass function is activated.

X = process variable available, — = process variable not available.

### 6.6.9 Application of the Health Indication Registers (Condensed Status Registers)

The SensyMaster FMT230, FMT250 has three "Health indication registers" (Condensed Status Registers). The "Health indication register 2104, 2105 and 2106 consist of 2 bytes, each containing 8 bits. Each bit represents an error.

The registers are structured as follows:

| 21         | 2104     |          | 05       | 21       | 06       |
|------------|----------|----------|----------|----------|----------|
| Byte 0     | Byte 1   | Byte 2   | Byte 3   | Byte 4   | Byte 5   |
| 01234567   | 01234567 | 01234567 | 01234567 | 01234567 | 01234567 |
| = true (1) | = false  | e (0)    |          |          | G12367   |

Fig. 31: Health indication register (Example)

The bit position is assigned to the errors in accordance with column "Byte / Bit pos." of the table in chapter 'Alarm status and alarm history status' on page 73.

The following assignment applies to the example in Fig. 31:

| Byte / Bit     | Fault message                   |
|----------------|---------------------------------|
| Byte 0 / Bit 3 | Flowrate to zero                |
| Byte 0 / Bit 5 | All totalizer stopp.            |
| Byte 4 / Bit 5 | Medium temperat exceeds limits. |

#### 6.6.10 Using the scan register

The SensyMaster FMT230, FMT250 has two "Scan Register" via which groups of parameters can be requested. As a result, the parameters do not need to be requested individually and the bus load on the Modbus is reduced.

A scan register consists of a configuration register and the actual scan register.

#### **Configuration register**

The Modbus addresses of the parameters are entered in the configuration register. These addresses are to be requested as a group when the scan register is read. The configuration is stored in the transmitter and must only be rewritten in the event of changes. A maximum of 32 Modbus addresses may be stored.

#### Scan register

When read out, the Scan Register returns the values of the parameters that were entered in the configuration register. The scan register has a length of 32 holding registers that must be considered when entering addresses in the configuration

For example, a maximum of 32 addresses with a register length of [1] can be requested via the scan register.

#### NOTICE

 If the total register length of the addresses entered in the configuration register exceeds the register length of the scan register, the response will be shortened accordingly when read out.

#### Restrictions

When using the Scan Registers, observe the following points:

- The Scan Registers are Read Only. It is not possible to gain write access to the parameters entered in the configuration register
- Action Registers cannot be addressed via the Scan Registers, as Action Registers require write access
- String Registers cannot be read out via the Scan Registers, as a String would overwrite the available register length of the Scan Register in most cases

# Design of the scan register (example) Content of the configuration register (Config scan register)

| Config scan register 1, register range 3101 3132 Config scan register 2, register range 3201 3232 |      |   |  |
|---|------|---|--|
|   |      |   |  |
| 3101 / 3201   | 201  | Mass flow in the selected mass flow unit (data type float, register length 2)             |  |
| 3102 / 3202   | 205  | Standard volume flow in the selected volume unit (data type float, register length 2)     |  |
| 3103 / 3203   | 215  | Mass flow counter reading in forward flow direction (data type float, register length 2)  |  |
| 3104 / 3204   | 217  | Standard volume flow counter reading in forward flow direction (data type float, register |  |
|   |      | length 2)   |  |
| 3105 / 3205   | 2104 | Diagnosis State 0 (Data type Usign 16, register length 1)                                 |  |
| 3106 / 3206   | 2105 | Diagnosis State 1 (Data type Usign 16, register length 1)                                 |  |
| 3107 / 3207   | 2106 | Diagnosis State 2 (Data type Usign 16, register length 1)                                 |  |
| 3108 / 3208   | 4013 | Mass flow unit Qm (data type Usign 8, register length 1)                                  |  |
| /   | 0    | Non-configured register spaces must be filled with "0".                                   |  |
| 3132 / 3232   | 0    |   |  |

## Response following the scan register request

In this example, 12 registers are used in the scan register.

| Scan register 1, registe | r range address 1101 1132   |  |  |  |  |
|--------------------------|---|--|--|--|--|
| Scan register 2, registe | Scan register 2, register range address 1201 1232                         |  |  |  |  |
| Read data register       | Register content  |  |  |  |  |
| 1101 / 1201              | Mass flow (data type float, register length 2)                            |  |  |  |  |
| 1102 / 1202              |   |  |  |  |  |
| 1103 / 1203              | Standard volume flow (data type float, register length 2)                 |  |  |  |  |
| 1104 / 1204              |   |  |  |  |  |
| 1105 / 1205              | Mass flow counter reading (data type float, register length 2)            |  |  |  |  |
| 1106 / 1206              |   |  |  |  |  |
| 1107 / 1207              | Standard volume flow counter reading (data type float, register length 2) |  |  |  |  |
| 1108 / 1208              |   |  |  |  |  |
| 1109 / 1209              | Diagnosis state 0 (data type Usign 16, register length 1)                 |  |  |  |  |
| 1110 / 1210              | Diagnosis state 1 (data type Usign 16, register length 1)                 |  |  |  |  |
| 1111 / 1211              | Diagnosis state 2 (data type Usign 16, register length 1)                 |  |  |  |  |
| 1112 / 1212              | Mass flow unit Qm (data type Usign 8, register length 1)                  |  |  |  |  |
| /                        | Non-configured register spaces remain unpopulated.                        |  |  |  |  |
| 1132 / 1232              |   |  |  |  |  |

## 6.6.11 Parameter descriptions

## Parameter range – Device Info

The parameterization of the device can be read out via the Modbus addresses listed here. All Modbus addresses specified here are read only.

| Modbus register     | Parameter name      | Data type [register length] / | Description   |
|---------------------|---------------------|-------------------------------|---|

## Parameter range - Output

| Modbus<br>register<br>address | Parameter name                    | Data type [register length] / value range                                   | Description  |
|-------------------------------|-----------------------------------|---|--|
| /Dig.Out                      | 41/42                             |   |  |
| /Dig.Out<br>4043              | Mode                              | TUSIGN8 [1] 0: Off 1: Pulse output 2: Frequency output 3: Binary output     | <ul> <li>Selection of the operating mode for the digital output 41 / 42.</li> <li>Off: Digital output deactivated.</li> <li>Binary: Digital output functions as binary output (for function, see the parameter "Signal Source Binary").</li> <li>Pulse: Digital output functions as pulse output (for process value, see the parameter "Signal Source Pulse"). In pulse mode, pulses per unit are given as output (e.g. 1 pulse per kg).</li> <li>Frequency: Digital output functions as frequency output (for process value see the parameter "Signal Source Freq").</li> </ul> |
|                               |                                   |   | In frequency mode for example, a frequency proportional to the flow rate is given as output.   |
|                               | 41/42 /Puls.Out 41/42             |   |  |
| The following                 | parameters are only availab       | ble if the digital output 41 / 42 has been                                  | configured as a pulse output.  |
| 4026                          | Signal Source Pulse               | TUSIGN8 [1] 1: Mass Flow 2: Standard volume flow rate                       | Selection of the process value issued via the pulse output.  |
| 5027                          | Quantity Pulses                   | TFLOAT [2]<br>1 1000000 pulses  | Set the pulses per mass unit or volume unit (see table 'Available units' on page 38) for the pulse output.   |
| 5031                          | Mass quantity or standard volumes | TFLOAT [2]  | The pulse value is a result of the ratio of "Quantity Pulses" per "Quantity Mass" or "Quantity Pulses" per "Quantity Volume@".   |
| 5029                          | Pulse Width                       | TFLOAT [2]<br>0.05 2000 ms  | Set the pulse width (low signal) for the pulse output.  The parameter directly limits the maximum possible output rate of pulses, e.g. max. 500 pulses/sec at 1 ms. If the calculation of the current output rate leads to an up-scale, the pulses are buffered and output with a delay.  Setting range: 0.05 2000 ms  |
| /Dig.Out                      | 41/42 /Freq.Out 41/42             |   |  |
| The following                 | parameters are only availal       | ole if the digital output 41 / 42 has been                                  | configured as a frequency output.  |
| 4022                          | Signal Source Freq.               | TUSIGN8 [1] 1: Mass Flow [%] 2: Standard volume flow [%] 3: Temperature [%] | Selection of the process value issued via the frequency output.  |
| 5023                          | Upper Range Value                 | TFLOAT [2]<br>0 10000 Hz  | Sets the frequency for the upper range value. The entered value corresponds to 100 %.  |
| 5025                          | Lower Range Value                 | TFLOAT [2]<br>0 10000 Hz  | Set the frequency for the lower range value. The entered value corresponds to 0 %.   |

| 5055            | Massflow Qm          | TFLOAT [2]                                       | Default setting of the device counter.   |
| 5057            | Volumeflow Qv@       |  |  |
| /FillMass       |                      |  | These parameters are only available when the FillMass function is activated.   |
| 4108            | Batch Process Value  | TUSIGN8 [1] 0: Off 65: Standard volumes 66: Mass | Selection of the process value used for the fill operation.  |
| 5053            | Preset Batch Total.  | TFLOAT [2]                                       | Sets the fill quantity using the selected unit.  When the defined fill quantity is reached, the configured binary output is activated.  NOTICE  Before setting the fill quantity, the corresponding process value must be selected with the parameter "Batch Process Value". |
| 9006            | Reset Cur.Batch Tot. | ACTION [1]                                       | Resets the parameter "Current Batch Total." to zero and prepares the next fill operation.  |
| 9008            | Start Batching       | ACTION [1]                                       | Starts the fill operation by writing any value to the corresponding Modbus address.  |
| 219 / 405       | Current Batch Total  | TFLOAT [2] / TDOUBLE [4]                         | Output of the current fill quantity.  Once a fill operation has been started, the quantity already filled is shown here. The counter restarts at zero for each fill operation initiated and then counts up to the set fill quantity.  This parameter is read only.           |
| 9010            | Stop Batching        | ACTION [1]                                       | Stops the fill operation by writing any value to the corresponding Modbus address.   |
| 3315            | Current Batch Counts | TUSIGN32 [2]                                     | Output of the number of fill operations since the last reset.  This parameter is read only.  |
| 9005            | Reset Batch Counts   | ACTION [1]                                       | Resets the counter "Current Batch Counts" by writing an arbitrary value into the corresponding Modbus address.   |

| Modbus register | Parameter name   | Data type [register length] / | Description   |  |  |
|-----------------|------------------|-------------------------------|---|--|--|
| address         |                  | value range                   |   |  |  |
| /FillMass /     | Lag Correction   |                               | These parameters are only available when the FillMass function is         |  |  |

|                 |                  |                               | — Automatic: The overrun quantity is calculated by the transmitter        |  |  |
|                 |                  |                               | automatically.  |  |  |
|                 |                  |                               | Manual: The overrun quantity must be determined manually and              |  |  |
|                 |                  |                               | entered in the selected unit via the parameter "Quantity".                |  |  |
| 5049            | Quantity         | TFLOAT [2]                    | Manually sets the overrun quantity correction value in the selected       |  |  |
|                 |                  | -0.0 100.0                    | unit.   |  |  |
|                 |                  |                               | Closing the fill valve takes some time and as a consequence more          |  |  |
|                 |                  |                               | liquid is added, even though the fill quantity is reached and the         |  |  |
|                 |                  |                               | contact for closing the valve is actuated.                                |  |  |
|                 |                  |                               | Only if the parameter "Mode" has been set to 2 - Manual.                  |  |  |
| 5047            | Quantity         | TFLOAT [2]                    | Output of the overrun quantity automatically calculated by the            |  |  |
|                 |                  | Read only or set to 0.0.      | transmitter. Only if the parameter "Mode" has been set to 1 -             |  |  |
|                 |                  |                               | Automatic.  |  |  |
| 5045            | Factor           | TFLOAT [2]                    | Sets the weighting of the last filling process during automatic           |  |  |
|                 |                  | 0.0 1.0                       | calculation of the overrun quantity.                                      |  |  |
|                 |                  | Factory setting: 0.25         | The calculation is based on the following formula:                        |  |  |
|                 |                  |                               | New correction value = last correction value + (Factor x correction       |  |  |
|                 |                  |                               | value during the last fill operation)                                     |  |  |
|                 |                  |                               | — 0.0: No change to correction value.                                     |  |  |
|                 |                  |                               | — 1.0: The correction value is immediately adjusted to the overrun        |  |  |
|                 |                  |                               | quantity calculated during the last fill operation.                       |  |  |
| 5051            | Time             | TFLOAT [2]                    | Sets the time for the overrun quantity correction after the fill valve is |  |  |
|                 |                  | 0.1 10 s                      | closed.   |  |  |
|                 |                  | Factory setting: 0.1 s        |   |  |  |

## 6.6.12 Software history

In accordance with NAMUR recommendation NE53, ABB offers a transparent and traceable software history.

| Device soft   | Device software package FMT2xx (Device Firmware Package) |             |   |                 |  |  |  |

# 6.7 FillMass batch function Only with FMT250

Fig. 32: Filling function FillMass (example  $CO_2$  filling) (1) Gas line ( $CO_2$ ) (2) Sensor (3) Fill start / stop (via Modbus) (4) Fill valve (5) Fill container

| Diag           | Diagram legend                       |  |  |  |
|----------------|--------------------------------------|--|--|--|
| VO             | VO Valve open (filling started)      |  |  |  |
| VC             | Valve closed (fill quantity reached) |  |  |  |
| t <sub>1</sub> | Valve closing time                   |  |  |  |
| t <sub>2</sub> | Overrun time                         |  |  |  |

The integrated FillMass batch function allows filling processes to be recorded in > 3 seconds.

For this purpose, the filling quantity is given via an adjustable totalizer.

The Modbus interface is used to configure and control the fill function.

The valve is triggered via one of the digital outputs and closed again once the preset filling quantity is reached.

The transmitter measures the overrun quantity and calculates the overrun correction from this.

Additionally, the low flow cut-off can be activated if required.

#### 6.7.1 Configuration

For the configuration of the fill mass function, the following steps must be performed:

- 1. The FillMass function must be active. See also parameter range '...Feature Settings' on page 54 .
- One of the two digital outputs 41 / 42 or 51 / 52 must be configured as a binary output with the function "Batch end contact". See also parameter range 'Parameter range -Output' on page 57.
- 3. The parameters for the fill mass function must be configured. See also parameter range . '...FillMass' on page 67 .

#### **İ** NOTICE

During fast filling processes, the damping should be set to the minimum value to ensure the greatest possible accuracy of the fill quantity.

See also parameter range . 'Parameter range – Device Setup' on page 49 .

#### 6.7.2 Filling process run

#### Initialization

The following steps must be performed before the initial start of a filling operation and e.g. in case of changes to the fill quantity:

Fig. 33: Initialization

#### **İ** NOTICE

The value for the outflow amount "Lag Corr. Quantity" depends on a number of factors (valve close time, flow velocity, pressure, etc.) The value must therefore be experimentally determined for every application.

#### **Fill operation**

The following steps must be performed for every fill operation:

Fig. 34: Fill operation

 The digital output DO1 / DO2 must be configured as "Batch end contact" for this purpose.

The current fill quantity for the present fill operation can be read out via the Modbus address 401 "Current Batch Total.". The number of fill operations performed can be read out via the Modbus address 3315 "Current Batch Counts". The counter can be reset via the Modbus address 9006 "Reset Batch Totalizer".

# 7 Diagnosis / error messages

#### NOTICE

All Modbus addresses in this chapter are indicated in the format "PLC Base 1".

#### 7.1 General remarks

Errors encountered are itemized in tabular form on the following pages. The response of the transmitter on error detection is described therein.

The table lists all possible errors together with a description of their impact on the value of measurement variables, the properties of current outputs and the alarm output.

If no entry is indicated in the table field, there is no effect on the measurement variable or no alarm signal for the particular output. The sequence of the errors in the table corresponds to the error priorities.

The first entry has the highest priority and the last has the lowest.

If multiple errors are detected simultaneously, the error with the highest priority determines the alarm condition of the measurement variable and the current output. If an error with a higher priority does not affect the measurement variable or the output status, the error with the next highest priority determines the status of the measurement variable and the output.

The following critical errors are indicated by slow flashing (frequency: 1 second) of the service LED in the transmitter terminal box. See also chapter 'Service LED' on page 28.

| Fault message                             | Error no. | Modbus address "Active alarm" |
|---|-----------|-------------------------------|
| Sensor memory defective.                  | M038.009  | 10                            |

### 8 Maintenance

#### 8.1 Safety instructions

#### **⚠** DANGER

#### Danger to life due to piping under pressure!

Sensors which may eject during installation or removal in piping remaining under pressure may pose a danger to life.

- Install or remove a sensor only if the piping is depressurized.
- As an alternative, use a pipe component with an integrated replacement device.

#### **⚠** WARNING

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

#### **A** CAUTION

Risk of burns due to hot measuring media.

The device surface temperature may exceed 70 °C (158 °F), depending on the measuring medium temperature! Before starting work on the device, make sure that it has cooled sufficiently.

#### **İ** NOTICE

#### Damage to components!

The electronic components of the printed circuit board can be damaged by static electricity (observe ESD guidelines). Make sure that the static electricity in your body is discharged before touching electronic components.

Corrective maintenance work may only be performed by trained personnel.

- Before removing the device, depressurize it and any adjacent lines or containers.
- Check whether hazardous materials have been used as materials to be measured before opening the device.
   Residual amounts of hazardous material may still be present in the device and could escape when it is opened.

Within the scope of operator responsibility, check the following as part of a regular inspection:

- the pressure-carrying walls / lining of the pressure device
- the measurement-related function
- the leak tightness
- the wear (corrosion)

#### 8.2 Flowmeter sensor

The flowmeter sensor is largely maintenance-free.

The following items should be checked annually:

- Ambient conditions (air circulation, humidity).
- Tightness of the process connections.
- Cable entries, cover gaskets and cover screws.
- Operational reliability of power supply, lightning protection and grounding.

#### 8.3 Cleaning

When cleaning the exterior of meters, make sure that the cleaning agent used does not corrode the housing surface and the seals.

To avoid static charge, a damp cloth must be used for cleaning.

#### 8.3.1 Clean measuring element.

It can be necessary to clean the thermal measuring element when measuring gases with damp contamination.

The cleaning interval depends on the degree of contamination of the measuring element and must be individually defined.

#### NOTICE

#### Damage to the sensor due to improper cleaning!

- Do not clean the measuring element with hard objects (screwdrivers, tweezers or wire brushes).
- Do not clean the measuring element in an ultrasonic bath.
- Do not clean or dry the measuring element with pressurized air.
- 1. Switch off the power supply.
- 2. Disconnect electrical connections.
- 3. Disassemble the sensor from the pipe component or changing device, as described in chapter 'Installing the sensor' on page 21 and 'Disassembly of the sensor during operation' on page 23.

- 4. Carefully clean the measuring element with warm water or an alcohol solution using a soft brush or cotton swab.
- 5. Allow the sensor to dry or carefully dry with warm air.
- 6. Check that the gasket between the sensor and pipe component or welding adapter is clean and in good condition; if necessary replace it with a new gasket (O-Ring Ø 55 mm x 3 mm (2.16 x 0.12 inch)).
- 7. Install the sensor in the pipe component or changing device, as described in chapter 'Installing the sensor' on page 21 and 'Installation of the sensor during operation' on
- 8. Perform electrical connection (see chapter 'Electrical connections' on page 24).
- Perform commissioning (see chapter 'Commissioning and operation' on page 28).

#### 8.4 Integrated hot tap fitting Replace the O-ring gaskets

#### **⚠** WARNING

### Danger of injury due to improper maintenance!

Danger of injury due to leaking measuring medium during disassembly of the changing device with piping under pressure.

Before starting maintenance, depressurize the piping and

#### ♠ WARNING

Risk of fire due to the use of non-permissible grease for oxygen applications.

Only use permissible fitting grease for oxygen applications (e.g. Krytox GPL-226).

After approx. 100 sensor installation and disassembly procedures, the O-ring gaskets on the changing device must be replaced. If you are working with dusty, abrasive or aggressive measuring media, it may be necessary to replace these more

O-ring gaskets may only be replaced by the manufacturer's service department or by qualified personnel employed by the operator.

Fig. 35: Gaskets on the changing device

(1) Sensor (2) Special screws (3) Protection cap (4) Fixing screw for union nut (4x) (5) Union nut (6) Flow direction

| O-ring seals |          |  |  |  |
|--------------|----------|--|--|--|
| Pos.         | Quantity | Design                                       |  |  |
| (A)          | 2        | O-Ring Ø 36 x 3 mm (1,42 x 0,12 inch), Viton |  |  |
| (B)          | 1        | O-Ring Ø 26 x 3 mm (1,02 x 0,12 inch), Viton |  |  |

- Disassemble the sensor (see chapter 'Disassembly of the sensor during operation' on page 23)
- Loosen the fixing screws of the union nut and pull the guide tube out of the changing device. Clean the guide tube if necessary.
- Replace both inside O-rings on the changing device and the O-ring of the guide tube. Lightly lubricate the O-rings as well as the threads of the union nut and slip ring of the guide tube.
- Insert the guide tube in the changing device and tighten the fixing screws of the union nut as far as the limit stop in exactly the same position as during disassembly.
- Verify correct installation by rotating the lock nut into measuring and disassembly positions.
- 6. Install the sensor (see chapter 'Installation of the sensor during operation' on page 23)

# 9 Repair

#### 9.1 Safety instructions

#### **MARNING**

Risk of injury due to live parts!

When the housing is open, contact protection is not provided and EMC protection is limited.

Before opening the housing, switch off the power supply.

#### **A** CAUTION

Risk of burns due to hot measuring media.

The device surface temperature may exceed 70 °C (158 °F), depending on the measuring medium temperature! Before starting work on the device, make sure that it has cooled sufficiently.

#### **İ** NOTICE

Damage to components!

The electronic components of the printed circuit board can be damaged by static electricity (observe ESD guidelines).

Make sure that the static electricity in your body is discharged before touching electronic components.

#### 9.2 Spare parts

Repair and maintenance activities may only be performed by authorized customer service personnel.

When replacing or repairing individual components, use original spare parts.

#### **İ** NOTICE

Spare parts can be ordered from ABB Service:

Please contact Customer Center Service acc. to page 2 for nearest service location.

#### 9.3 Fuse replacement

#### **İ** NOTICE

If the O-ring gasket is seated incorrectly or damaged, this may have an adverse effect on the housing protection class. Follow the instructions in chapter 'Opening and closing the housing' on page 23 to open and close the housing safely.

#### NOTICE

For devices for use in potentially explosive atmospheres in Zone 1 / Div 1, the fuse is sealed and cannot be replaced.

Fig. 36

There is a fuse in the transmitter terminal box (order number: 3KQR000443U0100).

Perform the following steps to replace the fuse:

- 1. Switch off the power supply.
- 2. Open the transmitter terminal box.
- 3. Pull out the defective fuse and insert a new fuse.
- 4. Close the transmitter terminal box.
- 5. Switch on the power supply.
- 6. Check that the device is working correctly.

If the fuse burns through again on activating, the device is defective and must be replaced.

#### 9.4 Returning devices

Use the original packaging or a secure transport container of an appropriate type if you need to return the device for repair or recalibration purposes. Fill out the return form (see the Appendix) and include this with the device.

According to the EU Directive governing hazardous materials, the owner of hazardous waste is responsible for its disposal or must observe the following regulations for shipping purposes: All devices delivered to ABB must be free from any hazardous materials (acids, alkalis, solvents, etc.).

Please contact Customer Center Service acc. to page 2 for nearest service location.

# 10 Recycling and disposal

#### 10.1 Dismounting

#### WARNING

#### Risk of injury due to process conditions.

The process conditions, e.g. high pressures and temperatures, toxic and aggressive measuring media, can give rise to hazards when dismantling the device.

- If necessary, wear suitable personal protective equipment during disassembly.
- Before disassembly, ensure that the process conditions do not pose any safety risks.
- Depressurize and empty the device / piping, allow to cool and purge if necessary.

Bear the following points in mind when dismantling the device:

- Switch off the power supply.
- Disconnect electrical connections.
- Allow the device / piping to cool and depressurize and empty. Collect any escaping medium and dispose of it in accordance with environmental guidelines.
- Use appropriate tools to dismantle the device, taking the weight of the device into consideration.
- If the device is to be used at another location, the device should preferably be packaged in its original packing so that it cannot be damaged.
- See the information in chapter ' Returning devices' on page 79.

#### 10.2 Disposal

This product and its packaging are manufactured from materials that can be recycled by specialist recycling companies.

Bear the following points in mind when disposing of them:

- This product is not subject to WEEE Directive 2012/19/EU or relevant national laws (e.g. ElektroG in Germany).
- The product must be surrendered to a specialist recycling company. Do not use municipal garbage collection points.
   Only privately used products may be disposed of in the municipal garbage according to the WEEE directive 2012/19/EU
- If it is not possible to dispose of old equipment properly,
   ABB Service can take receipt of and dispose of returns for a

#### NOTICE

Products that are marked with this symbol may not be disposed of through municipal garbage collection points.

### 11 Specification

#### **i** NOTICE

The detailed device data sheet is available in the download area at www.abb.com/flow.

#### 12 Additional documents

#### **I** NOTICE

www.abb.com/flow

All documentation, declarations of conformity, and certificates are available in ABB's download area.

#### **Trademarks**

# 13 Appendix

#### Statement on the contamination of devices and components

Repair and / or maintenance work will only be performed on devices and components if a statement form has been completed and submitted.

Otherwise, the device / component returned may be rejected. This statement form may only be completed and signed by authorized specialist personnel employed by the operator.
